

Session Objectives

At the conclusion of the session/course, the student should be able to:

1. Discuss the principles and goals of balanced ligamentous tension (BLT)
2. Differentiate between direct and indirect forces
3. Discuss some indications and contraindications for BLT
4. Discuss and correctly demonstrate BLT for the cervical spine, thoracic spine, and lumbosacral spine, and fibula (including interosseous membrane)
5. Correctly demonstrate the following: cervical, metatarsal, fibula head, and rib diagnosis; rib muscle energy technique (MET); cervical soft tissue technique and muscle energy technique; perform **soft tissue techniques** (ones that you were instructed to perform for any of the above regions)
6. Review Material from FOM Lab 6 and Lab 9

About technique

- Forces
- Practice awareness, take the time
- Follow principles
 - BLT, though categorized as passive, can involve respiratory cooperation
 - As always with any OMT, reassess (with BLT, you are constantly assessing)

BLT Techniques taught in this lab:

- Cervical spine (C2-7)
- Thoracic spine (T1-12)
- Lumbosacral spine (L5-S1)
- Fibula (including interosseous membrane)
